## 7:4 Worksheet: Kent Clark and the River Bank

---

---

*7:4 Worksheet: Kent Clark and the River Bank*

Lois stumbles upon her boyfriend Kent Clark. He is swinging from a rope. Lois uses her trusty stopwatch, and finds that when  $t = 3$  seconds, her boyfriend Kent Clark is at one end of his swing, where she measures the distance from the water to be  $y = -25$  feet. Lois then records the time when Kent reaches the other end of the swing at 19 feet from the shoreline (over the water). This occurs at  $t = 5.5$  seconds. Lois yells at her boyfriend: "You think you are 'all that' swinging one handed on that rope while wearing a tie and holding a brief case. Let me tell you Kent Clark; you are no Man Super!"

Ignore the effects of gravity and air pressure during the small interval of time that Lois observes Kent. Answer the following questions:

1. Write the equation expressing Kent's distance from the river bank in terms of "t" and sketch the graph of the sinusoidal curve (don't use the graphics calculator – fit the data by hand)

*Answer*

*7:4 Worksheet: Kent Clark and the River Bank*

2. Enter your equation into the graphics calculator and test it with Lois's recorded values.

*Observe the calculator graphs:*

3. How long is Kent Clark over water during the 5.5 seconds Lois times him?

*Answer:*

*Use the calculator graphs of your sinusoidal function to answer this question:*

*Now do the math:*

*Answer*

*7:4 Worksheet: Kent Clark and the River Bank*

4. Where was Kent when Lois started the stopwatch?

*Use the calculator graphs to help you:*

*Answer*

5. Lois watches as Kent loses his grip on the rope at 6.6 seconds. Does Kent land in the water or on the land? Explain your answer in detail.

*Answer*
