

4.1.2 Natural Selection and Speciation

Outline the mechanism of natural selection as a possible driving force for speciation by researching an organism of your choice and outlining its evolution.

There is a great deal of information on the internet on specific species for example the evolution of the horse, Darwin’s finches, mustard plant etc.

Complete the following table and be prepared to discuss with your class.

<p>Known fossil record and sequence, include names.</p>	<p>Name of organism of choice: _____</p>
<p>Major climatic/environmental pressures leading to the evolution of this species</p>
